Ionescu Iulcea, C. T. Sur l'intégration des fonctions
~~sur les espaces topologiques~~ ~~sur les espaces topologiques~~ ~~sur les espaces topologiques~~
 Sti. Mat. Fiz. 4, 75-83 (1952). (Romanian. Russian
 and French summaries)

The author defines an integral for functions defined on certain subsets of a given abstract set and with values in a separable abelian topological group. The integral is a natural generalization of an integral considered by the reviewer [Trans. Amer. Math. Soc. 82, 125-131 (1952); Amer. Rev. 4, 162] for functions with values in a convex linear topological space. Most of the fundamental properties of the integral are obtained in the more general situation, the only important exception being the general convergence theorem. (It seems plausible that an appropriate form of the convergence theorem might also go through.) The concept of a filter is used to good advantage here and seems to simplify matters somewhat. C. B. Rickart (New Haven, Conn.)

 Buzhor, S.

TITLE: Some properties of HgTe single crystals grown from solutions

SOURCE: Fizika tverdogo tela, v. 7, no. 6, 1965, 1808-1812

TOPIC TAGS: mercury compound, telluride, single crystal growing, crystal lattice structure, electric conductivity, Hall constant

ABSTRACT: The authors describe a method never employed before of growing single crystals of HgTe from dilute solutions, aimed at eliminating previously encountered difficulties with the production of single crystals of stoichiometric composition. The single crystals were obtained from solutions of 5 — 10 at. % of tellurium in mercury by very slow cooling from temperatures above 4500. Crystals up to 20 x 12 x 1 mm could be obtained by this method. The shape of the crystals depend on the cooling rate. An x-ray structural analysis has shown that the HgTe single crystals have a structure of the sphalerite type with a lattice constant $a = 6.466 \pm 0.002$ Å, corresponding to that calculated on the basis of data on the tetrahedral radii of the Hg and Te atoms. Measurements of the electric properties.

Card 1/2

L 2522-66

ACCESSION NR: AP5014585

3

have shown that the decrease in the carrier mobility is slower than in samples obtained by other methods. This is attributed to the high degree of perfection of the structure of the obtained samples. Measurements were also made of the temperature dependences of the conductivity and of the Hall constant. Doping the HgTe crystals with silver, copper, and other various impurities makes it possible to obtain p-type semiconductor crystals. Orig. art. has: 6 figures and 1 table.

TITLE: Electric properties of certain solid solutions of the system $Zn_xHg_{1-x}Te$

SOURCE: Fizika tverdogo tela, v. 7, no. 7, 1965, 2039-2046

TOPIC TAGS: tellurium compound, semimetal, semiconductor. Hall constant, electric conductivity, thermal emf, solid solution

ABSTRACT: The samples of the solid solutions were obtained by the Bridgman method in quartz ampoules containing previously synthesized tellurides of zinc and mercury in suitable proportions. The samples were cut from the single-crystal parts of the ingots and annealed for a long time (at 210C) in mercury vapor, the pressure was monitored. The electric properties measured were the Hall constant, electric conductivity, and the thermoelectric power. The results show that when $x=0.5$ the material has a semimetal character, and no transition to a semiconductor character is observed. In the range 0.04 to 0.5 the material has a semimetal character, which is related by the authors to the change in the effective

TITLE: Setup for drawing dendrite crystals

SOURCE: Pribery i tehnika eksperimenta, no. 1, 1966, 213-214

TOPIC TAGS: fiber crystal, dendrite, germanium, single crystal growing

ABSTRACT: Apparatus is described for drawing germanium dendrites with mirror-smooth finish, such as are needed for semiconductor devices with improved characteristics (Fig. 1). The apparatus has a different construction and different properties than those hitherto reported in the literature. The grown dendrites are of uniform dimension and length and have a low dislocation density. The apparatus can operate at vacuum 10^{-5} to 5×10^{-6} Torr. The germanium dendrites obtained were 2 - 8 mm thick, of length constant within 0.2 - 0.8 mm. The apparatus can be used to draw dendrites of other semiconductor materials without modification. Orig. art. has: 1 figure.

AUTHOR: Draganescu, V.; Komanichu, N.; Tatu, V.; Ionescu-Pallas, N.Zh.

TITLE: Hyperfine and isotope structure of the 5535 Angstrom line of Ba I

SOURCE: Optika i spektroskopiya, v.16, no.2, 1964, 182-186

TOPIC TAGS: hyperfine structure, isotope structure, isotope shift, barium(I), barium(I) resonance line, hfs theory, LS coupling calculations

ABSTRACT: The 5535 Å Ba I line has been investigated by H.Kopefermann and G.Wessel (Nachr.Akad.Wissensch.,Gottingen,Math.-Phys.No.2,53,1948), O.H.Arroe (Phys.Rev.,79, 836,1950) and later by D.A.Jackson (Ibid.,106,948,1967 and Proc.Roy.Soc.,A263,289, 1961), but only the last, who used absorption in an atomic beam, was able to discern hyperfine structure. The present theoretical and experimental investigation of this resonance line, associated with the $6s^2 1S_0 - 6s6p \ ^1P_1$ transition, was undertaken to check the experimental data and provide a theoretical explanation thereof. (Jackson noted a discrepancy between the observed and calculated intensities and hypothesized a small hfs (10 mK) for the odd isotopes.) The present experimental work was also carried out by the absorption in an atomic beam technique; the setup

Card 1/3

ACCESSION NR: APL020919

for obtaining the atomic beam was an improved version of the apparatus described by V. Draganescu (Opt. i spektro., 10, 301, 1961) and included provision for water-cooling of the evaporator in order to enhance the vacuum. A special device consisting of two mirrors with slits was employed to make the light beam pass several times through the atomic beam, in order to obtain substantial absorption without recourse to increasing the evaporator temperature. The light source was a hollow cathode tube into which the barium was introduced in the form of BaCl_2 . The spectroscopic instrument was an ISP-22 spectrograph crossed with a Fabry-Perot etalon; the interference patterns were photographed with an exposure of under 15 min and scanned on a Zeiss microphotometer. There were resolved in all 7 components arranged almost symmetrically with respect to the central 138 component in an interval of about 40 mK ($1 \text{ mK} = 10^{-3} \text{ cm}^{-1}$). The experimental data are compared in a table with the results of calculations based on the intermediate coupling theory of G. Breit and L. A. Wills (Phys. Rev. 44, 470, 1933), assuming Russell-Saunders (L-S) coupling. The computation formulas are adduced, and corrections are made for finite nuclear size and the nuclear magnetism distribution. The agreement between the experimental data and calculated values is satisfactory. The theory at present is not adequate for deciding for or against Jackson's hypothesis. The proposed interpretation allows of explaining some

Car 2/3

ACCESSION NR: APL020919

of the observed components. Nevertheless further measurements aimed at determining the broadening of the hfs in the spectra of separate isotopes are planned. "The authors are grateful to I. Agarbichan for useful discussions during the course of the work." Orig.art.has: 17 formulas and 1 table.

TITLE: Level population inversions in a gas medium

SOURCE: Optika i spektroskopiya, v. 17, no. 1, 1964, 139-141

TOPIC TAGS: quantum oscillator, laser pumping, level transition,
 laser material, gas laser

25

ABSTRACT: The question is considered of obtaining a negative temperature in a two-component gas mixture, satisfying the following conditions. 1. The atomic levels participating in the transfer of excitation from atom a to atom b are as shown in Fig. 1 of the Enclosure; 2) the levels n_a^* and n_b^{**} differ in energy by not more than several kT and have identical orbital quantum numbers; 3) the lifetimes of the levels satisfy the inequality $(\tau_b^{**} - \tau_b^*) > 0$; 4) the level lifetimes

Card 1/4

L 12936-65

ACCESSION NR: AP4042992

due to radiative transitions are much shorter than the duration of the transport of the excitation. The solution of the equations for the time variations of the populations of the five levels in question are analyzed and yield an equation for the excess of population at the level n_b^{**} relative to the population of n_b^* . This excess is accumulated in the cavity. From the pumping formula thus obtained it is concluded that it is desirable to use active media for which the difference $\tau_b^{**} - \tau_b^*$ is large. To have the wavelength of the stimulated emission as close as possible to the visible spectrum, the medium must be one of the last elements of the periodic-table groups with doublet levels, such as thallium, bismuth, and iodine. The ratio of the pressure of the two gases forming the mixture should be as close to unity as possible. "The authors are deeply grateful to Professor Agy*rbichan for interest in the work and for useful discussion." Orig. art. has: 6 formulas and 1 figure.

3401. IONESKY-MIKHEYESHT K., GORODNITCHANU F., ZAMFIRESKU M., KLEYN R., GANTCHEVITCH G., STERESKU P. and BUSHILE V. *Isolation of the Cocksackie virus from the faeces of a child suspected of poliomyelitis (Russian text) PEDIATRIJA 1955, 3 (19-23)

The first strain of Cocksackie virus was isolated in Rumania in 1953 from the faeces of an infant on the 6th day of illness, possibly poliomyelitis. Blood serum obtained from the infant on the 17th day of illness neutralized in dilution 1:5000 at least 50 LD of the virus in mice. Neutralization effect was also achieved with γ -globulin from pooled samples of human blood. On the basis of histopathology of newborn mice infected with the virus the latter belongs to the Daldorff group of Cocksackie viruses.

IONESUAN, A. S., ZAGALOVA, P. I., SHUTOV, A. I., and PITENKO, N. F.

"Condition of the Upper Respiratory Tract in Workers of the Electrolytic Shop of 'Elektrotsink' Plant," by Docent N. F. Pitenko and Clinical Physicians A. I. Shutov, P. I. Zagalova, and A. S. Ionesuan, Ear, Throat, and Nose Clinic, Severo-Otinskiy Medical Institute, Gigiyena i Sanitariya, Moscow, Vol 21, No 12, Dec 56, pp 48-49

The authors report the results of medical examinations of a number of workers employed at the electrolytic shop of "Elektrotsink" plant who complained of diseases of the upper respiratory passages. The examinations revealed serious affections of the passages: nosebleeds, ulcerations of the mucous membrane, perforations of the nasal diaphragm, and others, all undoubtedly caused by pungent substances which contaminated the atmosphere in the shop. The shop, it was found, had a large number of electrolytic baths filled with a neutral solution of neutral zinc sulfate. In the course of the electrolytic process, gas bubbles containing toxic substances are formed and evaporate forming a pungent fog which contaminates the atmosphere in the shop. In addition, it is thought that fluorite compounds which are present in the electrolytes in some quantities play their part in causing the affections.

On the basis of the examinations, a number of measures with a view toward improving hygienic-sanitary conditions at the shop and protecting of the workers' health are recommended. Among them are (1) the exclusion from employment in the shop of persons who may be susceptible to diseases of the upper respiratory tract, (2) proper ventilation, (3) the installation of facilities for drawing off the gases directly from the baths, (4) organized periodic washing of the mouth during work hours, and the application of vaseline to nasal mucous membrane before work begins, and (5) organized systematic inspection of the air in the shop.

TITLE: Distribution of ascorbic acid in the adrenal cortex of rats under acute cold induced stress

SOURCE: Biologia, no. 11, 1965, 862-866

TOPIC TAGS: adrenal gland, ascorbic acid, histology, rat, central nervous system, heat biologic effect, biochemistry

ABSTRACT: The concentration of ascorbic acid decreases under the conditions discussed. It was found that under stress the number of granules found by histological methods is directly proportional to the decrease of the content of ascorbic acid. When the content of ascorbic acid was decreased by means of various influences acting upon the CNS, there was no direct proportional connection between the two phenomena. ABSTRACT : The incubation periods of mildew upon the infection with the winter and summer spores are considered in connection with the periods and number of sprayings. The length of the incubation period is determined by proceeding from the average diurnal temperatures. On the oily spots, almost all conidiospores appear during the first three days after the formation of conidia carriers owing to which the new infections do not occur uninterruptedly but in flareups. The authors consider that the spraying of the vineyards should be done before

Abstract: [Author's English summary modified]: Two types of purified tuberculin (PPD) were prepared; that for mammals was standardized to a content of 100,000 T.U./ml, and that for birds to 25,000 T.U./ml. The results of large-scale tests on epizootically different animals permitted the practical application of the single tuberculin test with PPD to cattle, pigs and birds. The use of PPD allowed the introduction of the simultaneous testing of cattle for tuberculosis diagnosis, bringing about a clarification of the tuberculin reactions, a saving of time and the fact that only the animals suffering from tuberculosis, among those reacting to tuberculin, have to be sacrificed.

Abstract [Author's English summary modified]: Nodular dermatitis in cattle was diagnosed in Rumania by means of the characteristic skin lesions, bacterioscopic examination and, in one unit, histopathological examination. The afflicted animals reacted to tuberculin. Where the simultaneous tuberculation test was used, the reaction was greater to mammal type tuberculin than to the bird type, usually by 2 to 4 mm, in most cases; however, in some cases the two reactions were equal or were greater for the bird-type tuberculin.

"Aspects of Br. ovis Infection in Reproducing Rams."

Bucharest, Revista de Zootehnie si Medicina Veterinara, Vol 13, No. 9, Sep 63, pp 74-80.

Abstract [Authors' English summary modified]: One of the main causes of ram infertility is infection with Br. ovis which brings about partial or complete degradation of the sperm. As the most dangerous epizootic moment for transmitting the disease is natural interbreeding, artificial insemination in infected flocks is recommended. The changes in the sperm diagram of infected animals involve the density, mobility and presence of materials other than the sperm, such as epithelial and white cells and Br. ovis. Volume changes are not characteristic, but there may be color changes in the ejaculated sperm.
